Tropical Root And Tuber Crops: 17 (Crop Production Science In Horticulture)

Synopsis

Most of the world's poorest smallholders depend on tropical roots and tubers crops as their principal source of food and nutrition. These species produce large quantities of dietary energy and have stable yields under difficult environmental conditions. The most important crops are cassava, sweet potato, yam and the aroids, sharing important common traits such as bulkiness, post-harvest perishability and vegetative propagation. This book compiles the most up to date information on the origin, genetics, physiology, agronomy, pests and diseases and post harvest processing of these crops, while attempting to provide ideas for further research and development.

Customer Reviews

Well written and informative. Covers many different varities. Meant more for academia then the average gardener.

Very good book.
